

2021 WATER QUALITY REPORT AGUA FRIA

epcor.com

Safety. Quality. Community.

You'll hear these words spoken often around EPCOR.

At EPCOR, we're committed to providing you safe, quality, reliable drinking water every day. It's our mission, and it's an honor. Water fuels our economy, quenches our thirst, and breathes life into our daily routines.

But we can't take it for granted.
Our water system needs a steward, one who's there behind the scenes 24 hours a day, 7 days a week to manage, maintain and invest in it.

EPCOR takes this responsibility seriously. From daily water quality checks that ensure safety and quality to investing in your water system, we're ensuring that water will be available for years to come, whether your water source is deep underground or from rivers and lakes.

While the COVID-19 pandemic has created many uncertainties, we want to remind customers that your water is safe. The virus has not been detected in drinking water supplies, and there is no evidence to suggest that it survives the standard disinfection process.

In addition to monitoring the water that comes out of your tap, we're also maintaining and improving the miles of pipelines, water mains, wells and hydrants that make up your water system. We're ensuring that water isn't wasted, and that it's a resource that will be there for the long term.

Because every drop matters.

Sincerely,

Joe Gysel

President, EPCOR USA, Inc.

J. D. Appel

YOU WANT TO KNOW WHAT'S IN THE WATER YOU'RE DRINKING

As your water service provider, we're committed to ensuring the quality and safety of that water. That's why you are receiving this annual water quality report from us. We hope it will help you understand your community's water a little better and what we're doing to protect it.

WHAT WILL I FIND IN THIS REPORT?

This report complies with state and U.S. Environmental Protection Agency (EPA) drinking water regulations.

In it you'll find information on:

- Where your water comes from
- Protecting your water
- What's in your water

Information in this report is compiled, in part, from analytical data generated by laboratories certified in drinking water analysis.

READ THIS REPORT – AND SHARE IT!

Reading this report and understanding your community's water is the first step. But it's also important to share this information with those who might not receive it directly. If you're a landlord, business, school or hospital, please share this report with water users in your community.

QUESTIONS?

EPCOR Customer Care: 1-800-383-0834 mywater@epcor.com

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien.

ABOUT YOUR WATER AGUA FRIA

ABOUT YOUR DISTRICT

- EPCOR provides water service to nearly 55,000 service connections in the Agua Fria district.
- This service area covers parts of multiple cities and towns in the West Valley of metropolitan Phoenix, as well as master-planned communities in currently unincorporated areas of Maricopa County.

WHERE YOUR WATER COMES FROM

- The Colorado River via the Central Arizona Project (CAP)
- Agua Fria river water captured behind the new Waddell Dam at Lake Pleasant
- Groundwater pumped from the West Salt River Valley (WSRV) Sub-Basin

About your CAP water

 CAP water is primarily comprised of Colorado River water delivered from Lake Havasu via the CAP Canal and then from the Beardsley Canal to the White Tanks Water Treatment Facility.

White Tanks Water Treatment Facility

• The Agua Fria district receives treated, renewable surface water from the White Tanks Water Treatment Facility. The facility utilizes state-of-the-art treatment processes designed to meet current and future water quality requirements. Using a renewable water source is an important step in making our communities more sustainable. In fact, the use of White Tanks saves billions of gallons of Arizona's limited and precious groundwater each year.

GETTING INVOLVED

Consulting with the community is important to us. If you have a question, concern or suggestion about your local water system, please contact our Customer Care team at **1-800-383-0834**.

NOTICE OF SOURCE WATER ASSESSMENT

In 2004, the Arizona Department of Environmental Quality (ADEQ) completed a source water assessment for 15 wells used by EPCOR-Agua Fria. The assessment reviewed the adjacent land uses that may pose a potential risk to the sources. These risks include, but are not limited to, gas stations, landfills, dry cleaners, agriculture fields, wastewater treatment plants and mining activities. Once ADEQ identified the adjacent land uses, they were ranked as to their potential to affect the water sources. The results of the assessment were that six wells had adjacent land uses that posed no risk, 10 wells had one adjacent land use that posed a low risk, and two wells had one adjacent land use that posed a high risk. The complete assessment is available for inspection at the Arizona Department of Environmental Quality, 1110 W. Washington, Phoenix, AZ 85007, between the hours of 8 a.m. and 5 p.m. For more information please contact **ADEQ** at **602-771-2300**.

Additional Information about the groundwater in your area

- The West Salt River Valley (WSRV) Sub-Basin is a broad, gently sloping alluvial plain with the following boundaries:
 - North: Hieroglyphic Mountains and Hedgpeth Hill
 - South: South Mountains, Estrella Mountains and Buckeye Hills
 - West: White Tank Mountains
 - East: Union Hills, Phoenix Mountains and Papago Buttes
- Depth to groundwater in the WSRV Sub-Basin varies from approximately 150 feet to more than 500 feet
- Sources of groundwater recharge include natural recharge from stream flows and along mountain fronts, incidental recharge from agricultural and urban uses, and intentional recharge at constructed recharge facilities such as EPCOR's Northwest Valley and Verrado recharge facilities.

How We Protect Groundwater Together

Both groundwater and the associated pumping and delivery facilities are part of a complex system that needs not just monitoring, but also maintenance. From pipelines to water mains, wells to hydrants, we're ensuring that the groundwater supply is protected and accessible.

How You Can Help

Properly dispose of hazardous household chemicals on hazardous material collection days and limit your pesticide and fertilizer use. For information on household hazardous material collection days in your area, contact the **Arizona Department of Environmental Quality** at **602-771-2300** or **Earth911.com**.

WHAT YOU CAN EXPECT TO FIND IN YOUR WATER

SOURCES OF DRINKING WATER

The sources of drinking water—both tap water and bottled water include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over land surfaces or through the ground, it can acquire naturally occurring minerals. In some cases it can also acquire radioactive material and substances resulting from the presence of animals or from human activity.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk.

More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Information Hotline at 1-800-426-4791

DID YOU KNOW?

- One-Part-Per-Million (mg/L or ppm) is equivalent to one inch in 16 miles.
- One-Part-Per-Billion (ug/L or ppb) is equivalent to a single 4-inch hamburger in a chain of hamburgers long enough to circle the earth at the equator 2.5 times.
- One-Part-Per-Trillion (ng/L or ppt) is equal to a single drop of water being diluted into 20 Olympic-size swimming pools.

SUBSTANCES THAT MAY BE PRESENT IN SOURCE WATER

Microbial Contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations or wildlife.

Inorganic Contaminants, such as salts and metals, which can be naturally occurring or may result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.

Pesticides and Herbicides, may come from a variety of sources, such as agriculture, urban stormwater runoff and residential uses.

Organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and may also come from gas stations, urban stormwater runoff and septic systems.

Radioactive Contaminants, which can be naturally occurring or may be the result of oil and gas production and mining activities.

ENSURING YOUR WATER IS SAFE

To ensure that tap water is safe to drink, the EPA prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. To ensure bottled water is safe to drink, U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water.

WHAT YOU CAN **EXPECT TO FIND IN** YOUR WATER

SPECIAL HEALTH INFORMATION

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants may be particularly at risk from infections. These people should seek advice about drinking water from their healthcare providers. EPA/ CDC (Centers for Disease Control and Prevention) guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the EPA's Safe Drinking Water Information Hotline at 1-800-426-4791.

Lead

EPCOR monitored the water for lead and copper in 2021 at 60 residences throughout the community and met the federal lead and copper standards. The 60 houses sampled were representative of the types of houses throughout the system. If your house was sampled you would have received the analysis results. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. EPCOR is responsible for providing highquality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the Safe Drinking Water Information Hotline or at www.epa.gov/safewater/lead.

DID YOU KNOW?

Tap water costs a lot less than what you pay for other beverages. A gallon of water costs you about 1 penny. Compare that to the cost of a gallon of these beverages*:

- Milk = \$3.97/gallon
- Orange Juice = \$2.65/gallon
- Beer = \$16.23/gallon
- Bottled Water = \$1.67/gallon
- Wine = \$25/gallon
- * Costs for milk, orange juice and bottled water obtained from Bureau of Labor Statistics and Beverage Marketing Association reports. Other costs determined by calculating average supermarket pricing for bottles of soda, wine and beer and converting to a gallon.

Seasonal changes in hardness and taste

Because your water supply contains both surface water and groundwater, you may experience seasonal changes in the hardness and the taste of your water. The hardness and taste difference between surface water and groundwater is normal and completely safe.

HOME WATER TREATMENT UNITS

Failure to perform maintenance on your home water treatment unit can result in poor water quality. If you installed a home water treatment system such as a water softener or reverse osmosis system, please remember to follow the manufacturer's instructions on operation and maintenance. For more information, contact the manufacturer of your treatment system for maintenance instructions or assistance. Additional information about home water treatment systems is available from the Water Quality Association at **630-505-0160** or by visiting wqa.org.

FREQUENTLY ASKED QUESTIONS

WHAT IS THE WHITE OR COLORED DEPOSIT ON MY DISHES OR FAUCETS?

In most cases, the deposits or sediments left behind after water evaporates are calcium carbonate. The amount of calcium in the water is referred to as hardness. Cleaning with white vinegar can help to dissolve and remove deposits. Using a commercial conditioner, liquid detergents or the "air-dry" option in dishwashers can help to decrease the calcium carbonate found on dishes.

ARE THE DEPOSITS OR HARD WATER HARMFUL?

Hardness and/or the deposits left by hard water don't pose a health concern and may have health benefits. We don't treat drinking water for water hardness that can result in hard water deposits.

WHAT IS THE LEVEL OF HARDNESS IN MY WATER?

The hardness in your water ranges from 2 to 18 grains per gallon (gpg).

Degree of water hardness range (gpg)

Soft Less than 1
Slightly Hard 1 to 3.4
Moderately Hard 3.5 to 6.9
Hard 7 to 10.4
Very Hard Greater than 10.5

WHY IS MY WATER CLOUDY OR MILKY IN APPEARANCE WHEN IT COMES OUT OF THE TAP?

Water that appears cloudy or milky is typically caused by trapped air (very small air bubbles) in the water. If this occurs, simply let the water stand for a few minutes—the air will dissipate leaving a clear glass of water.

The quality of your water depends on the source water itself as well as factors such as the geology and biology of the area where the water came from. For some elements that are known to have an effect on the aesthetics of the water quality parameters, the EPA has established guidance levels known as secondary maximum contaminant level standards (SMCLs). When levels of these contaminants are found to be above the SMCLs, they may impact the aesthetic quality of the water (e.g., color, taste and odor). Although aesthetic water qualities may vary, your water meets all state and federal regulatory standards and is safe to use for all drinking water purposes. Secondary contaminants include, but are not limited to, manganese, iron and total dissolved solids (TDS).

WHY IS CHLORINE ADDED TO MY DRINKING WATER?

Chlorine is added to your water for your protection and is used as a disinfectant to ensure that harmful organisms, such as bacteria and viruses, are destroyed in the treatment process.

ARE THERE OTHER WAYS TO REMOVE THE CHLORINE TASTE OR SMELL FROM MY WATER?

To remove the taste of chlorine from your water, try these tips:

- Place water in a glass container in the refrigerator overnight, uncovered. This will let the chlorine dissipate.
- Bring your water to a rolling boil for five minutes and let it stand to cool.
- Add a slice of lemon or a few drops of lemon juice to your glass of drinking water.

WILL MY HOME TREATMENT DEVICE REMOVE CHLORINE?

Some home treatment devices can remove chlorine. Once chlorine is removed, the water should be treated like any other beverage product and used as quickly as possible. We recommend that you follow the manufacturer's instructions for maintaining the device to ensure water quality.

DEFINITION OF TERMS

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

GPG (grains per gallon): Used to describe the dissolved hardness minerals contained in water and is a unit of weight that equals 1/7,000 of a pound.

HAA5 (Haloacetic Acids): Consist of Monochloroacetic Acid, Dichloroacetic Acid, Trichloroacetic Acid, Bromoacetic Acid and Dibromoacetic Acid.

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG (Maximum Contaminant Level Goal): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MNR: Monitored, not regulated.

MRDL (Maximum Residual Disinfectant Level): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG (Maximum Residual Disinfectant Level Goal): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NA: Not Applicable.

ND: None Detected.

NTU: Nephelometric turbidity units.

ppb (Parts per Billion): One part substance per billion parts water (or micrograms per liter).

pCi/L (Picocuries per Liter): Measurement of the natural rate of disintegration of radioactive contaminants in water (also beta particles).

ppm (Parts per Million): One part substance per million parts water (or milligrams per liter).

ppt (Parts per Trillion): One part substance per trillion parts water (or nanograms per liter).

SMCL (Secondary Maximum Contaminant Level): Nonenforceable guidelines regulating contaminants that may cause cosmetic or aesthetic effects in drinking water.

Total Dissolved Solids: An overall indicator of the amount of minerals in water.

TT (Treatment Technique): A required process intended to reduce the level of a contaminant in drinking water.

TTHM (Total Trihalomethanes): Consist of Chloroform, Bromoform, Bromodichloromethane and Dibromochloromethane.

UCMR (Unregulated Contaminant Monitoring Rule): Unregulated substances are measured, but maximum contaminant levels have not been established by the government.

WHAT'S IN YOUR WATER

HOW TO READ YOUR WATER QUALITY TABLE

Below, you'll see an analysis of your drinking water. **Here's an example of how to read these tables:**

Substance (units)	Year Sampled	MCLG	MCL	Highest Amount Detected	Range of Detections	Compliance Achieved	Typical Sources
Start here and read across	2020 or year prior	The goal level for that substance	Highest level of substance allowed	Highest amount that was found	Highest and lowest amounts found	Yes means the amount found is below gov't requirements	Where substance usually originates

YOUR WATER QUALITY TABLE

The data shown in the tables below are results from commercial laboratories certified in drinking water analysis by the Arizona Department of Health Services.

The table shows what substances were detected in your drinking water during 2021 or the last required sampling period within the last five years.

Regulated Substances Measured in the Water Leaving the Treatment Facility

Substance (units)	Year Sampled	MCLG	MCL	Highest Amount Detected	Range of Detections	Compliance Achieved	Typical Sources
Arsenic (ppb)	2021	0	10	8.3 ¹	ND - 8.3	YES	Erosion of natural deposits
Barium (ppm)	2021	2	2	0.11	ND - 0.11	YES	Erosion of natural deposits
Fluoride (ppm)	2021	4.0	4.0	1.69	0.28 - 1.69	YES	Erosion of natural deposits
Nitrate (ppm)	2021	10	10	2.53	ND - 2.53	YES	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Selenium (ppb)	2021	50	50	2.9	ND - 2.9	YES	Erosion of natural deposits
Sodium (ppm)	2021	NA	MNR	90	73 - 90	YES	Erosion of natural deposits
Gross alpha excluding radon and uranium (pCi/L)	2020	0	15	2.4	2.1 - 2.4	YES	Erosion of natural deposits; Certain minerals contain/emit this radiation form
Chromium (ppb)	2021	100	100	59	ND - 59	YES	Erosion of natural deposits
2, 4-D	2021	70	70	0.3	ND - 0.3	YES	Runoff from herbicides used on row crops

WHAT'S IN YOUR WATER

Turbidity² – A Measure of the Clarity of the Water at the Treatment Facility

Plant	Year Sampled	π	Highest Single Measurement	Compliance Achieved	Typical Sources
Highest single turbidity measurement	2021	1 NTU	0.142	YES	Soil run-off
% Monthly samples < 0.3 NTU (%)	2021	95% of samples < 0.3 NTU	100%	YES	Soil run-off

Regulated Substances Measured from the Water in the Distribution System

Substance (units)	Year Sampled	MCLG/ MRDLG	MCL/ MRDL	Highest Running Annual Average	Range of Detections	Compliance Achieved	Typical Sources
TTHMs (ppb)	2021	NA^3	80	54.4	ND - 80.7 ⁴	YES	By-product of drinking water disinfection
HAA5 (ppb)	2021	NA^3	60	24.0	ND - 31	YES	By-product of drinking water disinfection
Chlorine residual (ppm)	2021	4	4.0	0.82	0.71 - 0.97	YES	Water additive used to control microbes

Microbiological Monitoring in the Distribution System

Substance (units)	Year Sampled	MCLG	MCL	Highest Number of Positive Monthly Total Coliform Samples	Highest Monthly Percent of Positive Total Coliform	Number of Positive E. coli Samples	Compliance Achieved	Typical Sources
Total Coliform Bacteria	2021	0	NA	1	0.98	0	YES	Naturally present in the environment

Customer Tap Water Samples: Lead and Copper Results

Substance (units)	Year Sampled	MCLG	Action Level	Number of Samples	90th Percentile	Number of Samples Above Action Level	Compliance Achieved
Copper (ppm)	2021	1.3	1.3	120	0.1	0	YES
Lead (ppb)	2021	0	15	120	ND	1	YES

WHAT'S IN YOUR WATER

Unregulated Substances Measured from the Water Leaving the Treatment Facilities

Substance (units)	Year Sampled	Range of Detections	Typical Sources
Calcium (ppm)	2019	7 - 73	Erosion of natural deposits
Hardness (grains/gallon)	2019	2 - 17.8	Natural Calcium/Magnesium content
Magnesium (ppm)	2019	3 - 27	Erosion of natural deposits
pH (standard units)	2021	7.6 - 8.7	pH is a measure of acid/base properties
Total dissolved solids	2021	170 - 750	Natural deposits

Unregulated Contaminated Monitoring Rule Substances Measured at the Treatment Facility and in the Distribution System

Substance (units)	Year Sampled	Range of Detections	Typical Sources
Germanium (ppb)	2019	ND - 0.5	Erosion of natural deposits
Manganese (ppb)	2019	ND - 5.2	Erosion of natural deposits
Quinoline (ppb)	2019	ND - 0.029	Chemical manufacturing, agricultural run-off
HAA6Br (ppb)	2019	ND - 23.7	By-Product of Drinking Water Disinfection
HAA9 (ppb)	2019	ND - 54.4	By-Product of Drinking Water Disinfection

'Arsenic: EPCOR's groundwater arsenic removal facility continues to produce water with arsenic levels below the current federal and state standards. While your drinking water meets EPA's standard for arsenic, it does contain low levels of arsenic. EPA's standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

²Turbidity has no health effects. However, turbidity can interfere with disinfection and provide a medium for microbial growth. Turbidity may indicate the presence of disease-causing organisms. These organisms include bacteria, viruses, and parasites that can cause symptoms such as nausea, cramps, diarrhea and associated headaches.

3TTHM/HAA5: Although there is no collective MCLG for this contaminant group, there are individual MCLGs for some of the individual contaminants: Trihalomethanes: bromodichloromethane (0.0 mg/L); bromoform (0.0 mg/L); chloroform (0.07 mg/L); dibromo-chloromethane (0.06 mg/L). Haloacetic acids: dichloroacetic acid (0.0 mg/L); trichloroacetic acid (0.02 mg/L). Monochloroacetic acid (0.07 mg/L), bromoacetic acid and dibromoacetic acid are regulated with this group but have no MCLGs.

4TTHM/HAA5: Some people who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys or central nervous systems, and may have an increased risk of getting cancer.

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

At EPCOR, we're committed to providing water and water service you can count on. We test water in our systems daily, and adhere to stringent Federal and local guidelines, including checking at various stages of its cycle — from wells and canals to the tap itself to ensure that the water you receive is safe. It's a process our water quality experts repeat over 300,000 times a year to make sure water meets drinking water standards and to monitor for contaminants.

Why am I receiving this information?

We routinely monitor water quality parameters that may impact both the aesthetic quality and corrosiveness of the water. Alkalinity and pH results collected for the six-month compliance periods of July 1, 2021 through December 31, 2021, and January 1, 2022 and June 30, 2022, exceeded the allowable number of samples to fall outside water quality parameters established by the Arizona Department of Environmental Quality (ADEQ). The water quality parameters were established in an effort to help reduce the potential of lead and copper leaching from plumbing components. State and federal lead and copper regulations require that 90% of all compliance samples collected from customers' homes test below the action levels of 0.015 mg/L and 1.3 mg/L, respectively. The EPCOR Agua Fria water system has always met these stringent standards. Specifically, the most recent lead and copper compliance sampling event conducted in June 2021 resulted in 98% of the samples meeting the lead action level and 100% of the samples meeting the copper action level.

What does this mean?

This is not an emergency. If it had been, you would have been notified within 24 hours. However, typically, lead and/or copper enters water supplies by leaching from lead and/or copper or brass pipes and plumbing components. For this reason, new pipes and plumbing components containing lead are no longer used; however, many older homes may contain lead pipes. Your water is more likely to contain high lead and/or copper levels if water pipes in or leading to your home are made of lead, contain lead solder, or are made of copper.

The following health effects language is for informational purposes only. The EPCOR Agua Fria water system has historically, and currently meets all state and federal lead and copper water quality standards:

Lead Health Effects: Infants and children who drink water containing lead in excess of the action level could experience delays in their physical or mental development. Children could show slight deficits in attention span and learning abilities. Adults who drink this water over many years could develop kidney problems or high blood pressure.

Copper Health Effects: Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilson's disease should consult their personal doctor.

Do I need to do anything?

Listed below are some general steps you can take to reduce your exposure to lead and copper:

- Call us at the number below to find out how to get your water tested for lead and/or copper.
- Find out whether your pipes contain lead or lead solder.
- Run your water for 30 seconds to 2 minutes or until it becomes cold before using it for drinking or cooking. This flushes any standing lead and/or copper from the pipes.
- Do not cook with or drink water from the hot water tap; lead dissolves more easily into hot water.
- Do not boil your water to remove lead and/or copper. Excessive boiling water makes the metals more concentrated - the lead and/or copper remains when the water evaporates.

What is being done?

EPCOR water quality and operations staff are working collectively with ADEQ representatives to ensure corrosion control is optimized for the Agua Fria water system understanding the unique nature of naturally occurring water quality parameters of the local aquifers coupled with the temperature extremes face in Arizona.

*Please share this information with all the other people who drink this water, especially those who may not have received this notice directly such as people in apartments, nursing homes, schools and businesses. You can do this by posting this notice in a public place or distributing copies by hand or mail.

We regret any inconvenience this notice may cause you. Our Water Quality experts are available to answer your questions by phone at 623-445-2431 or by email at mywater@epcor.com.

This notice is being sent to you by EPCOR specific to the Agua Fria water system (PWS ID# AZ0407695).

Date distributed: June 3, 2022

ADDITIONAL MONITORING

In addition to the parameters listed in this table, other parameters were monitored for, including regulated pesticides, herbicides, petroleum by-products and metals. None of those parameters were detected in the water. If you have any questions about this report or your drinking water, please call our **Customer Care** team at **1-800-383-0834**.

EPCOR encourages feedback related to the quality of water that is provided to you. Please feel free to submit comments to us directly at **mywater@epcor.com**. You may also provide feedback to the Arizona Corporation Commission (ACC).
